

# How to Mine Manna with a SHA256 ASIC Antminer

1. Download, install and sync the Manna Qt wallet that works with your operating system from this page on the Mannabase website: <https://www.mannabase.com/technology/>
2. Copy your wallet address from the “Receive coins” tab of your Manna Qt wallet.
3. The built-in Antminer software has a “General Settings” tab. In that tab, fill in the fields as follows:
  - “URL” field: stratum+tcp://pool.mannacurrency.net:3333
  - “Worker” field: your Manna wallet receive address that you copied in step 2 above.
  - “Password” field: enter a simple password, e.g. 123

The miner should locate the Manna mining pool server and start mining blocks.

NOTE: Your Antminer will need to access the Internet. Configure the network settings as needed.

To verify the miner is sending shares and to see your hash rate, check this URL: <http://pool.mannacurrency.net:8000/workers>. Mining hash rate is a key factor to the amount of coin reward.

Coins will be sent directly to your wallet. Please allow 24 hours before checking for received coins.
